1. Patch May 2020

The chapter below describes changes and updates done to existing features that were made during our May 2020 patch. Different Dapresy Pro installs were updated on different dates.

1.1 StoryTeller

Link to slides would not work when link and target slide are in the same report

If the icon shape was set to have a link to a slide and this slide was in the same report the link would not work. This has been fixed.

Hover settings for text boxes not working

Adding a hover event to a text box, e.g. change text color when the mouse pointer was over the text box, was not working correctly. This has been fixed.

Sort chart on table and vice versa

In the Storyteller a chart can be sorted by another chart or another table and vice versa. This logic was previously not clear as the label in the sorting interface was “Other chart”, the label has now been updated to “Other chart/table”

1.2 Input Variables

Calculations for days failing

There was an issue with updating dependent input variables using a number of days added in some circumstances, specifically the first time the date value was populated.

1.3 Compute Variables

Issues with calculations with encoded characters in definitions

When a question text included a character like < > & which must be encoded when displayed in a browser, the compute variable definition was not working correctly, this has been resolved. All characters can be used.

1.4 Data Import Setup

Stored Password in External Data Services and Scheduled tasksData Export

Previously the password and other secure credential boxes were populated from the stored credentials. This has been changed so that the stored credentials are never displayed, now there is only the possibility to over write the stored values.

Here we see the password text box has been replaced with a button:

FTP Server address:

FTP Username:

Password:

1.5 Data Export

Export settings incorrect when admin switches between projects

There was an issue with settings being saved incorrectly in the users session not being cleared, this meant switching between projects could cause issues with loading the variables selected for export. This would be seen as an error opening the data export screen.

1.6 Admin screens

Projects access rights working incorrectly

In some rare circumstances an admin user would not be able to see a project they should have access to. There was an issue with setting the access rights correctly for all administrator users which is fixed.
